Hi All,

I am developing a ToolBand from few days, using this toolband the user can insert the elements into the webpages. The only thing user has to do is make a selection of element and place it on webpage.

for inserting the element I have written code like :
spElt = spDoc.elementfrompoint(x,y)
spElt.insertAdjacentHTML("beforeEnd", "Element tag")

This code works fine...But it fails when I click on some image in webpage, its giving error "Invalid target element for this operation".

I would appriciate some clues/pointers...

Thanks in advance,

Regards,
Vishal

.
