I have a Browser Helper Object (BHO) that subscribes to the BeforeNavigate2 event. For debugging purposes, the BHOs class writes to a temporary file so I know when it's being instantiated and when BeforeNavigate2 is being called.

In one scenario (Win2K3 Server R2 SP1, IE 6 SP1, logged in as Administrator), the BHO works fine and BeforeNavigate2 is called by IE.

In a 2nd scenario (Win2K3 Server, IE 6, logged in as Administrator), I can see that the BHO's class is instantiated; but BeforeNavigate2 is never called.

In both cases, the BHO's DLL is installed in the directory c:\bho and registered as follows:

```
regasm /codebase bho.dll
```

Does anyone have ideas as to why scenario #2 is not working, what else I can look at to further diagnose this problem, or other steps to take in debugging this issue.

Thanks.
