

Avoid re-post IE message

When you try to refresh a page that has posted data on it, IE pops up a message box saying: "The page cannot be refreshed without resending the information. Click Retry to send the information again, or click Cancel to return to the page that you were trying to view."

I would like to refresh the page and always use the Retry option (which reposts the data, AFAIK). Is there a way to do that? Just navigating to the same link that I'm currently on won't work because then the page loses any context that is on it's forms.

Thanks in advance,
Chad
