The environment is like this:

+windows 2000
+IIS
+ASP 3.0
+MS SQL 2000

The asp that runs the process has this portion of code:

```
set Conn1=Server.CreateObject ("ADODB.Connection")  
set Conn2=Server.CreateObject ("ADODB.Connection")  
set rs=Server.CreateObject ("ADODB.Recordset")
```

```
Conn1.Open Application("strConexion")  
Conn2.Open Application("strConexion")
```

```
SQL = "spS_PrepareFunnelForecastReport '" & strFechaParam & "'" & ""  
Conn1.Execute(SQL)
```

```
SQL = "select * from temptbFunnelForecast"  
SET rs = Conn2.Execute(SQL)
```

and the stored proc spS_PrepareFunnelForecastReport is like this:

```
SELECT tbStates1.zona_geografica, Usuarios1.Nombre AS Gerente,  
Usuarios_1.Nombre AS PBM, Usuarios2.Nombre AS TSG, Usuarios3.Nombre AS PSG,

Hello,

Regarding the issue, would you please show more detailed code? For example, how did you call the store procedure, query and display the data in the ASP page, and what is the query you executed in query analyzer? Based on my experience, this is more like an problem in coding. So we better double check the logic in the code.

Sincerely,

Luke Zhang
