Thank you so much. I will try that.

"Bob Barrows [MVP]" wrote:

You don't use it to run the stored procedure. You use it to trace commands being run by sql server while your asp page is attempting to run the stored procedure.

In other words, start sql profiler, create a new trace and start it, open your browser and navigate to the asp page that is giving you the problem. Look at the trace to see if you asp page successfully connected to the server and issued the command to execute the stored procedure.

Justin Doh wrote:

Hi Bob,

Wow, I did not know there was SQL Profiler at SQL 2005.
How do I use SQL Profiler at SQL 2005 to run the stored procedure?

Thanks in advance.
Justin

"Bob Barrows [MVP]" wrote:

You are attempting to call it from an ASP page, correct? You need to verify that when you run the ASP page, that the procedure is actually getting called. The best way to do that is via SQL Profiler.

How do I use "on error resume next"?

Re: Issue with retrieving large data over web using Stored Procedure

???

I meant for you to look in your vbscript code in your .asp file and verify if an "on error resume next" statement exists in your code.

If it does, comment it out so you can see any errors that occur.

Justin Doh wrote:

Actually the stored procedure works fine because it retrieve data while I execute the sp at the SQL Server 2005.

I don't think I need to check at the SQL Profiler because I am testing at the SQL 2005 level. How do I use "on error resume next"?

Thanks in advance.

Hello.
I moved my stored procedure and tables from SQL 2000 to SQL 2005. I am having an issue to retrieve a large amount of data using previous stored procedure (sp) over web (ASP page). Other sp works fine, but one sp that retrieves

Re: Issue with retrieving large data over web using Stored Procedure

large
amount of
data does
not even get
executed
over ASP
page.

Have you verified this with
SQL Profiler? If not, you
should.

First,
I tried to
increase the
server
timeout by
doing this
way.
<%
server.ScriptTimeout
= 40000 %>

Second,
I also
included
ConnectionTimeout
and
CommandTimeout
to see if it
would help
any such
as..

With
rsReport
.ConnectionString
=
ConnOLAP
.ConnectionTimeout
= 4800

This one is irrelevant to this
issue

Re: Issue with retrieving large data over web using Stored Procedure

```
.CommandTimeout  
= 4800
```

4800 is ridiculous,
especially if the procedure is
not getting
executed.

```
.Load(strSQL)  
End With
```

When I
executed sp
at SQL
Server 2005
level, I got
the data fine
(after long
period of
process),
but when it
gets
executed
over web
(ASP), no
data gets
retrieved.

Is there any
suggestions
to fix this
problem?

If you have "on error resume
next" anywhere, comment it
out so you
will see errors.
