Hi, I am trying to write some code to perform a INSERT in SQL table using a loop. What would be great is a way of dynamically entering in data in a request form

ie the final code should look something like:

```
if Request.Form("type1") = "1" then
```

where the 1 in "type1" is dynamic so the code would look something like

```
Request.Form("type" & Rs("fld_type_id") & ") = "1" then
```

But not sure how to form this or whether it would work, anyone have any idea?
