My thanks to Nathan for the code below, but it does not work. I get the following error;

Error Type:

Microsoft VBScript compilation (0x800A03EA)

Syntax error

/dev/development/WAN RCI Secure/DumpSearch.asp, line 700

Function AuthCheckT

How can I get this to work?

Cheers, Bill.

Use some Javascript code to check the window.opener value. If it is null, the window was navigated directly to. If it is not null, it will contain a reference to the window that opened it – you code would look something like:

```
<script language=javascript>

function doLogin() {
  if (window.opener == null) {
    document.location.href = "default.asp?status=timeout";
  }
  else {
    window.opener.document.location.href =
"default.asp?status=timeout";
    window.close();
  }
}

<%
Function AuthCheck()
  If IsEmpty(Session("UID")) then
    Response.Write "doLogin();"
  End If
End Function
```

%>

</script>

The ASP code MUST be inside the script block – the JScript function will always be on the page, but only when the ASP checks the session and finds nothing there is the call to the function written up to the browser. I didn't actually test the Javascript, so it might not be 100% accurate, but you should be able to get the idea.
