Thank you for your help. I like to have everything on 1 HTML page but there are alot of fields, so I split the fields onto more than 1 HTML page (I might just use only 1 HTML form and use the html tag# if I have to). Can one submit each HTML page to the same ASP file? I am using this ASP file to write all those parameter values to a text file. I am thinking to use the session object to keep track of the parameters from the separate HTML pages. Is this possible and/or there is a better way? Thank you
