[Please understand that this is a classic asp only NG,
so I will read your Q as page.asp, not page.aspx]

```
<form action="page2.asp" method="post">
```

is just like

```
<a href="page2.asp">
```

but for the form data being included in the page request [header].

"redirect" usually is understood as a directive issued by the server to the browser to look at another page, which is not the case here.
