Sorry, I should say clear:

I wrote a "hello world" asp, the following error returned:

\*\*\*\*\*

There is a problem with the page you are trying to reach and it cannot be displayed.

HTTP 500 – Internal server error

Internet Explorer

\*\*\*\*\*

The configuration of "MyWebsite" are summarized:

- Virtual Directory:
  - Checked "Read"
  - Execute Permissions: Scripts only
  - Application Protection: Medium (Pooled)
  - Configuration....
    - .asp -> C:\winnt\system32\inetsrv\asp.dll
    - Enable buffering
    - Default ASP language: VBScript

The IIS version is 5.0 with Windows 2000 server.

What should I do for a new user defined Website for asp application?

Peter

> As for your ASP problem, the solution would be to fix whatever is not working. You know that and I know that. What's not working though is something you know, but I don't know. You probably know it isn't working because you saw or heard something to make you think that. I was watching the girl walking across the street and listening to my iPod, so I missed what you must have seen or heard.
