Hello everyone I have a question. The school I am working for is in the beginning process of having a webpage that will direct students to download there homework and be able to view there info like test scores and etc(the homework and info page will reside on our websevers at the school on the local intranet network). Now what I need is a way for the students to go to a login page and when logging in will be automatically directed to there own personal index.htm page that will reside in a folder containing all there information and homework. I had downloaded a free ASP script which basically uses a Access DB to authorize the username and password and gives 2 diffrent asp result pages either "Granted" or "No Access". Now the only thing I can think of is to put a script in each students virtual directory and when getting to there index file have this script run and the results will let them in or give them no access but I think that would be way to much. So what do you guys recommend and is there any links you know that I can get some info from?

Here is the code from the free code I got

```
-----  
<%  
'Dimension variables  
Dim adoCon 'Database Connection Variable  
Dim strCon 'Holds the Database driver and the path and name of the  
database  
Dim rsCheckUser 'Database Recordset Variable  
Dim strAccessDB 'Holds the Access Database Name  
Dim strSQL 'Database query string  
Dim strUserName 'Holds the user name  
  
'Initialise the strUserName variable  
strUserName = Request.Form("txtUserName")  
  
'Check the database to see if user exists and read in there password  
'Initialise the strAccessDB variable with the name of the Access  
Database  
strAccessDB = "users"
```

microsoft.public.inetserver.asp.general: Need help with ASP script.

```
'Create a connection object
Set adoCon = Server.CreateObject("ADODB.Connection")

'Database connection info and driver
strCon = "DRIVER={Microsoft Access Driver (*.mdb)};uid=;pwd=letmein;
DBQ=" & Server.MapPath(strAccessDB)

'Set an active connection to the Connection object
adoCon.Open strCon

'Create a recordset object
Set rsCheckUser = Server.CreateObject("ADODB.Recordset")

'Initialise the strSQL variable with an SQL statement to query the
database
strSQL = "SELECT tblUsers.Password FROM tblUsers WHERE tblUsers.UserID
=" & strUserName & ""

'Query the database
rsCheckUser.Open strSQL, strCon

'If the recordset finds a record for the username entered then read in
the password for the user
If NOT rsCheckUser.EOF Then

    'Read in the password for the user from the database
    If (Request.Form("txtUserPass")) = rsCheckUser("Password") Then

        'If the password is correct then set the session variable to True
        Session("blnIsUserGood") = True

        'Close Objects before redirecting
        Set adoCon = Nothing
        Set strCon = Nothing
        Set rsCheckUser = Nothing

        'Redirect to the authorised user page and send the users name
        Response.Redirect"authorised_user_page.asp?name=" & strUserName
    End If
End If

'Close Objects
Set adoCon = Nothing
Set strCon = Nothing
Set rsCheckUser = Nothing

'If the script is still running then the user must not be authorised
Session("blnIsUserGood") = False

'Redirect to the unauthorised user page
Response.Redirect"unauthorised_user_page.htm"
```
