I have been getting this error on simple ASP code on my web site

Microsoft OLE DB Provider for ODBC Drivers error '80004005'
[Microsoft][ODBC SQL Server Driver][TCP/IP Sockets] SQL Server does not exist or access denied.

The Web Server is running on NT(sp6a) and IIS 4.0
The database is on a separate Windows 2000 (Sp 4) with MS SQL Server 2000 (8.00.760)
And the PDC on a separate NT(sp6a) server.
The application is accessed via a Cisco PIX 515 Firewall.

This error appears intermittently at random times without any specific pattern and rebooting the PDC then web server always clears the problem.

I have replicated the application inside the firewall and this runs trouble free so it would appear the problem is either with the web server or the firewall but as I have little experience of either I am unsure where to start.

Any pointers would be gratefully received.

Apologies if this is the wrong forum – wasn't sure where to post

Iain
