We had a web site on a Win2K / IIS 5 server and were able to browse the site via ftp using the Windows Explorer, so users could replace files.

We moved the site to Win 2003 / IIS 6.

We can now browse the site via ftp using Windows Explorer from Win 2003 machines only. Browsing the site using Windows Explorer on a Win2K machine does not display the directory contents. We can connect but can not display directory contents.

Found nothing in the knowledge base.

Is there any way to use Windows Explorer on Win2k against an ftp site on Win 2003?
