what do you get when connecting via ftp.exe ?

530 ? home directory inaccessible ? double check the ntfs permissions.

I need to setup FTP on a W2K3 Ent with each user having access to his own folder. I've created Windows logins for each user, and have created virtual directory for each user under the FTP site. The virtual Directory name is the same as a Windows Username. The problem is that no user can login to our FTP site. What is missing from this setup that doesn't allow users to login?

Thanks,

Gilgamesh
