If i do a quote pasv it passes both internal and externally from the network.
What does that mean?

In IIS i set the passive port range for 5500 – 5550, and opened those ports in the windows firewall and the network firewall with the same results. The Server is in the DMZ, and the ftp site is bound to a specific public IP. Internally and externally the site only works in active mode, Command line ftp works, telnet connection to force passive results in connection lost by remote host. From the Server it self browsing works in passive and active. The clients recieve FTP operation Timed out. I have the time out set to 400 right now.

"Bernard Cheah [MVP]" wrote:

what port range you set ? without firewall locally does it works?

Re: Passive Mode issue

and without firewall – remotely on the same LAN, does it works?

I am running Windows 2003 r2 x64 SP2,
and IIS 6 with 2 ftp sites and a
website running. The problem i see is fully
related to passive mode
FTP,
and
my firewall configuration. All users inside
and outside can connect if
they
turn off passive FTP from IE or use a ftp
client such as winSCP.

The server will timeout from all users trying
passive mode. I have set
the
passive port range for IIS and opened those
ports in the firewall, with
no
luck.

One special configuration i must note is the
wan IP's for the 3 sites
are
all run from the same NIC.

I have opened up all ports to that specific IP
for the ftp sites and
still
fails on pasv mode, and windows firewall
turned off as well. The
clients
return connection timeout when using
passive mode. I have seen other
posts,
with similar symptoms but, non of the
suggestions seem to help.

Re: Passive Mode issue

I cant put my finger on what i am missing on
the config. Someone
please
help.

thank you,
