i will have to look at the isa, its another thing that has been below my radar
i didn't set up the server initially, but i have provisioned all the ports on the router,
however since it worked once, i'm thinking that the isa setup was ok then, and i certainly haven't made any changes to it. the server automatically gets it updates from ms, so maybe one of those made some changes that affect the ftp
since the last time ftp worked, i have installed php and mysql, which i have on the default port 3306,
i have had problems, posted before here, but never resolved with the site timing out, when transferring multiple folder layers using the explorer option under tools. timed out no matter how long i set the timeout limit.

Ya. it looks like only the first part that it get through, then something in between drop it.
if you ftp locally at the server works?
do you have a publishing rules in ISA (SBS) that allow ftp traffic?

and do you know what changed recently ? as it was working before.

Re: site stopped working

i ran portqryv2, -local, it did not indicate anything other than ftp was listening on 21
when i connect with ie, it just hangs, if i connect with command line ftp, i get a 220 ms ftp service reply, and then it hangs for about 1 minute, never get a prompt for username, then disconnects, 'connection closed by remote host'
i ran portqryv2 remote and got
TCP port 21 (ftp service): LISTENING
but same thing as command line, it just dropped it
so it seems like i am getting thru the router (and sbs internal firewall?)
so if i am getting thru, any thing else to check?
thanks
bob

1) The binding error, could be due to port conflict, make sure no other program is binding on the site ip/port.

2) Temporary disable the firewall.... if still the same maybe at router level blocking? this should be networking related as it works locally.

for sbs2003/iis 6.0
had a virtual ftp site working with required user logon, anonymous not allowed. then something happened somewhere somehow, and can not connect to site. no errors in the ftp log but the could not bind instance 115 error showed up in the system log, so i stopd and restarted site, there's no more could not bind 115 errors, in the sys log but still can't access the site.
my firewall still has the same port 21

Re: site stopped working

firewall config as before. i can
access the ftp site on the sbs machine only,
can't access on my lan or
external thru the web.
any suggestions?
bob
