I currently have IIS 6 setup to serve as an SMTP server for my domain, however since I have a dynamic IP assignment from my ISP my SMTP server is considered blacklisted by many email hosts. Is there any way I can setup my SMTP server to relay mail through another SMTP server, specifically my ISP's, so that mail sent through my server will not be considered spam?

BTW: I do not spam, only a few of my friends use my server and must authenticate.

Thanks in advance for your help.
