It happens to everyone who is running ASP... Quick fix:

I have had a similar problem in the past and a very quick fix that works for this is:

Using "Scheduled Tasks" I created 3 entries that "Reset" IIS every 8 Hours. You will find IISReset here: C:\WINNT\system32 and run "iisreset.exe" It takes about 35 to 45 seconds each time it resets IIS but it works and it's Free. Just create a "New Task" for each time you want it to run.

One other thing you may want to consider is RamBooster (<http://www.sci.fi/~borg/rambooster/download.htm>), I have it set to optimize my Ram when ever it runs below 125 megabytes of free ram. It refreshes your ram and releases ram that is no longer in use... it works and it's also Free.
