All this does is recreate the IIS Out of Process objects in COM+. Doing this will not solve your problem.

In my experience, it's not ASP that has crashed and taken out your app, it's your app that has crashed and taken out ASP and IIS. People don't fall and break their hip...their hip breaks and they fall because it's broken...

Do you have any custom components written in VB that are not compiled with Retain in Memory and Unattended Execution selected?
