Thanks for pointing to this article. I am not sure if this will help me.

Let me explain my issue using a fictitious web site called "cakewalk.com".

The secure site is <https://intranet.cakewalk.com>. But I need to provide an "http" version i.e. <http://intranet.cakewalk.com> that the users can set as their default home page (without having to authenticate the user). The only link on this page will be <https://intranet.cakewalk.com>. On clicking this link the Windows authentication dialog box will be displayed.

The primary reason for doing this "dead" http page is that if the users set <https://intranet.cakewalk.com> as their default home page then the first thing that they will be shown on launching the browser would be the Windows authentication dialog box. The purpose of this "dead" page is to avoid presenting the Windows dialog box until the user clicks on the "https" link.

Any help is greatly appreciated.
