By default, IIS6 only serves static content unless otherwise enabled/configured.

When you install IIS6, there are check boxes to enable ASP and ASP.Net, which would enable IIS6 to only serve out those types of dynamic content.

By default, the web server's worker processes cannot even change IIS configuration. Thus, if you said that ASP pages worked before but suddenly do not work now, then something other than the webserver has changed its configuration.

You should look up help/google for how to resolve 404.2 errors. In your case, you should go an enable the ASP Web Service Extension inside the IIS Manager UI.

Actually, I saw that every time I try to access an ASP page it gives me a message saying that "Internet Explorer cannot find..." and then I went to the IIS log files and realized that it is returning a 404-2 message "Denied to Lockdown Policy"

I don't understand why would this happen if nothing in the configuration of this server has changed. Again, any help is welcomed

Thanks!
