not there, however i recall reading somewhere that IIS 6 might have some built in functionality?

regardless, this **was** working, it got borked when i elected to apply inheritance override on the Default Web Site after adding an application script mapping for PHP.

i finally got OWA working again, and this is the last step towards repairing it completely. and no, unfortunately, there was no IIS backup :-(

any other ideas? i'm at a complete loss...
thanks for your time.. please advise.
