Hello,

What version of IIS is this?

If it is IIS5 or IIS5.1 or IIS6 running in the IIS5 isolation mode, do the following:

- 1) Right click on the site, go to Properties
- 2) On the Home Directory tab, set the Application Protection to Low
- 3) Browse the asp page again and confirm if it serves up.

If this is IIS4,

- 1) Right click on the site, go to Properties
- 2) On the Home Directory tab, uncheck the option Run in separate memory space
- 3) Browse the asp page again and confirm if it serves up.

When you have Application protection set to Low , the asp page is run in the inetinfo.exe process under the context of the Local System account. When running in Medium or High Application protection (separate memory space) the IWAM account is the identity of the process thats executing the ASP pages.

If you can browse the asp page after following the above steps, it is likely that the IWAM account is out of sync or locked out or disabled. You can confirm this by looking at the event logs.

Please review:

<http://support.microsoft.com/default.aspx?scid=kb:en-us:309051>

Hope this helps!!!

Thanks,

Yogita Manghnani
