Hi,

there is maybe a strange function in the IIS or in Frontpage. I can't find a the reason. by myself. So I need some help.

I published a website as an update of old pages with FTP on our IIS5 Server (W2K-Server). The design and all fuctions are working after the first tests over the internet.

After a while (maybe hours) the design changed to different text-styles and a flash on the homepage dosn't work anymore.

There was no information in any log what happend.

I found out, that I must delete the site in the IIS-configuration. Than arrange a new entry, same than the old configuration and the design was again like we want (styles and working flash). But after a certain time the layout changed again. This is to reproduce.

This experience I tried:

I copied the full website to another directory gives this web a new name and published the site only over an IP. There was no change over two weeks.

I removed all links to the old side configuration from the server include the entries in the registry. But als this gives only a help for a little time.

Is there in the IIS or in Frontpage a funktion that restore old styles for a given name of a website? Has anybody heard about such a problem?

For an answer I would be happy

Helmut
