Hello,

Can you please in a cmd prompt on a machine that cannot access the website via IP write this:

```
nslookup www.yourdomain.com
```

Does it return a valid IP?

Where is your DNS hosted? On your webserver? Then you probably need to open the port for DNS aswell.

Anyway, since it works without ZoneAlarm enabled, it seems to be a configuration problem with ZoneAlarm, don't you think? So a newsgroup/forum for this product would probably help you better, since nothing indicate that there is something wrong with IIS.
