Where are you looking for IIS errors? There are three logs that need to be monitored, depending on what you are looking for:

1. W3SVC Logs – this logs request-specific information, including application execution errors
2. HTTPErr Logs – this logs connection/error information
3. Event Logs – this is where FYI/dramatic errors are logged (i.e. failure to start website, w3wp crash, etc)

A 404 file not found requires you to look at log #1 (because the website definitely is running, and it's not a connection/error -- so it's a request-specific error). Please provide the exact log lines for the 404 responses -- I'm interested in the sc-substatus and sc-win32 error codes that are logged for those 404s.

I get the 404 file not found error. All these web sites were working on
Win2K
with IIS 5. I transfered all the info to IIS 6 on 2003 server and now only 5
sites will work.
All the sites are configured the same. I have checked and rechecked a
hundred times to make sure each site is set correctly. I also deleted and
reinstalled the DNS records and each web site but still only 5 sites will
work. I am about ready to uninstall 2003 server and go back to Win2K that
worked correctly.
I don't have any DNS errors in the vent log or any IIS errors either.
