Dear all,

I am trying to setup SSL for OWA access via https: so far without any success.

I have been following instruction cases below without success

case 1– Microsoft Knowledge Base Article – 218445

<http://support.microsoft.com/default.aspx?scid=kb:en-us:218445>

and

case 2 – Creating Certificate Hierarchies with MS Certificate Server Version

1.0

<http://support.microsoft.com/default.aspx?scid=kb:en-us:186012>

in Case 1, when I try to Request a Client Authentication certificate, fill in the form and click on submit, it comes to a download of kgaccept.asp and I can't go any further.

in Case 2, Done everything as instructed and getting to the finally stage of establish certificate–base trust between the root and the subordinate, the certificate never can start with the event id as following:

Event ID: 12

Source: CertSvc

Type: Error

Description

The Certificate Server did not start: Unable to find the CA certificate in the certificate store for NissinSubCA. The error code is 0x80092004.

Any help or direction appreciated.
