New installation of php 5.0.1 on a new windows 2000 advanced server running IIS 5. Followed all the instructions for manual installation. Trying to get the browser to open a php page results in an authentication dialog box. Repeatedly pressing "OK" in Mozilla just keeps bringing up the authentication dialog. Pressing cancel results in "HTTP 401.1 – Unauthorized: Logon Failed". Pressing cancel in IE results in "HTTP 401.3 – Access denied by ACL on resource"
IUSR DOES have proper permissions to the content folders and asp scripts work fine.
Any ideas?
Thanks,
Clark Alexander
