

Multiple SSL sites on one server

Hi,

I have an IIS 5 server which is currently hosting our exchange 2003 outlook web access over ssl.

I have also setup a redirect site on the server which will direct any incoming http request to the https site (asp file using response.redirect).

Anyway – this was the only site running on this box so using host headers was never a problem.

But I now have to host a separate site on the box (which also needs to be ssl) – what I cant figure out is how to get both sites functioning with a redirect and obviously using host headers.

For example the domain names are site1.domain.com and site2.domain.com – I want the users to be able to put either one of those domain names into their browsers (i.e. without having to put https:// in front of it) and they will automatically get redirected to either <https://site1.domain.com> or <https://site2.domain.com>

Any suggestions?

Cheers

Paul Adam
