Primary problem solved. There was an entry needed in the httpHandler section of the machine.config file. A person on microsoft.public.dotnet.framework.aspnet pointed me to this article, <http://www.microsoft.com/india/msdn/articles/57.aspx> which helped to clarify the problem and solution.

> *In moving a ASP.NET site from a W2K IIS5 server to a new W2K3 IIS6 server, we are having trouble with what appears to be ASP.NET server side includes in the .shtml files. I did not set up the old server or code the site and have just been brought onto this project so I'm hoping someone out there with a tad more experience can help me.*

>

> *"Server cannot access application directory <my directory>. The directory does not exist or is not accessible due to security settings".*

>

> *Fine. I went and granted rights to the folder to my ASPNET account as per documentation. Still same error. Then I looked at the old server and noticed that the Everyone account has access to the web folders. Fine. I granted that permission. When I did that, the server dumps the the whole file to the browser and does not interpret anything. Its just like it read it like a text file.*
