Hi there,

Incoming traffic on port 80 is being routed to our Windows 2003 box running IIS. This works fine for our primary domain which is configured in the "Default Web Site" space listening on port 80. However, we have registered 2 different domains and I wonder whether it's possible to configure IIS to have domain x.com routed to the first IIS site and have domain y.com traffic to another IIS site (which will be listening on a non-80 port I suppose).

Can this be achieved transparently by configuring IIS only? Or do we need 2 IIS boxes?

FYI: our external router/firewall is not capable of filtering HTTP headers [I think]

Thanks,
