Checkout the readme files for VS.NET – they explain how to install some VS.NET server components on your web server. In the process, a local VS Developers group will be created. Just add your developers' domain accounts to this group. There will also be a share created named wwwroot\$ pointing to \Inetpub\wwwroot. IIRC, the group will be given NTFS change permissions to this folder – if not do it yourself. VS.NET will then use this share to connect to.
