We have two extranet sites (IIS 6) on the same server (Win 2003). Both sites is using basic authentication (with SSL), and gets the user's credentials from the same AD. We can't use anonymous access.

Each site has its own IP-address. The users are using the following URL to access the sites aaa.bbb.dk and ccc.bbb.dk.

When the users log on to site aaa.bbb.dk they get a logon dialog. A link from this site direct the users to the other site (ccc.bbb.dk), where the users again gets a logon dialog.

We don't want the logon dialog for site ccc.bbb.dk when the user already has logon to site aaa.bbb.dk.

What can we do?
