Thanks Ken, no need to apologise. This is my first attempt at debugging anything like this, and prior to posting my issue here, I learned quite a lot going back through the archives and reading posts from you and Pat. It is reassuring that, at least tentatively, we agree that it may be worthwhile to look into replacing that component with something else and seeing if that helps.

I was really just curious that both components would raise a textbox with such similar error messages. As a script monkey who doesn't know a compile flag from a debug symbol, does the error code "203" signify anything important, like an underlying IIS issue that might be causing them both to bomb?

Thanks again,  
Matt
