I would recommend using a domain account for the anonymous, application pool accounts.

We have two IIS 6.0 Servers that are load balanced..WEBSERVER1 and WEBSERVER2

Each server has a separate IUSR account. IUSR_WEBSERVER1 and IUSR_WEBSERVER2.

We need to have each IIS 6.0 Server to have the same account, such as IUSR_WEBSERVER.

What is the preferred way?
Rename both accounts as IUSR_WEBSERVER or create a new IUSR account on each.

Thank you...
