This is more of an OS / networking question than IIS related. I'd check in the networking newsgroup.

One idea would be to add a static route locally on the server. I've done that in the past for certain things.

I have an asp.net based site that has pages that make outbound requests to an external site for data. The request always goes out on the physical servers NIC (network card) IP address rather than that of the sites bound (IIS configured) IP address. Is there any way to enforce the use (bind) the outbound connection to a configurable IP address other than the NIC's address?
?
Thanks in advance
