I am trying to set up an intranet search facility so that staff can search for files on our server by file content. The server is running "Windows Server 2003 Enterprise Edition" and the files are MS Office files (.doc, .xls etc.)

So far I have setup the "Indexing Service" to catalog files in a test folder and this is working fine at the server. I even managed to get it to index Outlook message files by changing the persistent handler value in the registry for .msg files to the same value that was set for .doc, .ppt, .xls etc.

There is the "Query the Catalog" facility under "Computer Management" which works on the server but how do I make this query form available to the whole of our network.

Could someone please be kind enough to outline the steps involved or point me to a web site that gives instructions. I am assuming I need to install IIS 6???

Thanks in advance

.
