Very helpful to be able to separately test the individual components of a message!

I was getting a 550 problem with any recipients I tried. I changed the SMTP server's Relay Restrictions to allow all systems to relay. That solved the 550 problem, but messages are still getting hung up in the Queue folder.

My test computer is at my home, on a Comcast (broadband cable) network. My computer doesn't have a DNS domain name--only an IP address. Could that be causing a problem?

Thanks--
