Hi Erik –

One of the problems could be that the configuration for mschapv2 might not be correct.

Is the winxp machine part of a domain? And is the user logging in as a domain user? The default Mschapv2 configuration has the setting: "use domain credentials to authenticate" selected. If the user logged into the machine is not a domain user, then this setting will obviously not work. Try unchecking the box. In this case the user will get prompted to punch in the credentials.

Thanks,
Mudit

> I've set up one DC, running win2003, one RADIUS server, also running
win2003 and IAS. and I am trying to connect my WinXP computer, using PEAP
and MS-CHAP v2. I also got an Compaq wl-410 AP, which is set up for RADIUS.
The connection is up, because if turn off "authenticate users on this
server" in IAS, the client gets IP. But if I check this option, which I do
want (to enable authentication), I get an error i event log. The error
displays a wrong username, which is "User 00a0c5-b211733 was denied access",
it seems like this username is based on the MAC-adress on the clients NIC.
This is not the username I've prompted, which is "Andre". How come the
correct username is not displayed in event log? I would believe this is the
cause of why I can't get authenticated. Can someone please help me, I am
very frustrated!
