Probably the easiest approach is to install W2K on the new hardware, then install IAS.

On the old server export the IAS configuration to a file using netsh commands.

Copy the file to the new server and use netsh commands to import the IAS configuration.

>*From the IAS Help:*

To copy the IAS configuration to another server:

At a command prompt, type `netsh aaa show config <path>\file.txt`. This stores the configuration settings, including registry settings, in a text file. The path can be relative, absolute, or a UNC path.

Copy the file you created to the destination computer, and at a command prompt on the destination computer, type `netsh exec <path>\file.txt`. A message appears indicating whether the update was successful.

Notes

You do not need to stop IAS on the destination computer to run the netsh

microsoft.public.internet.radius: Re: Moving IAS to new server

exec command. When the command is run, IAS is automatically refreshed with the updated configuration settings.

This procedure will not work if the source and destination computer are running different versions of Windows 2000.

This procedure replicates all IAS, remote access policy, registry, and logging configuration.
