Hey

Ive got large W2K3 IAS setup authenticating all kinds of logins. Currently IAS authenticates users logging into Cisco Routers and Switches via telnet or SSH to admin the box, it authenticated VPN users connecting to a Cisco router for access to the Inside Network, its also authenticating my PEAP 802.11 clients. This is all working real nicely... :)

All right , now I wanna lock things down. I know all my Cisco gear is sending the Attribute 5 NAS-Port to the RADIUS server , however it doesnt look like IAS has the ability to look for that Att.?. I wanna use it because any VPN users are coming on NAS-Port 500 and users trying to login via telnet or ssh are coming in on NAS-Port 68 or a few higher.

Am I missing something or doesnt IAS support this?

Thanks a lot

Timo
