Good Morning,

I have been dealing with a strange issue. I have a wireless and Established Radius network. I have deployed PEAP with MSCHAP V2 and TKIP since May of 2006 successfully. We use IAS server and our own certificate server. All the servers are 2003 SP1 and the Access point are Cisco 1100 series.

All the current workstation on the wireless network work fine. Even if I remove and reconfigure the setting for the wireless profile they will connect no problems. I figure this eliminates just a simple password issue.

However I have 3 new machines I need to add and they will not connect. The only error I get from the cards is that authentication has failed. When I view the IAS log it give me the error IAS_AUTH_Failure. I have confirmed these workstations have received a certificate from the server and the credentials are correctly entered.

I would really appreciate any and questions or comments to help me brainstorm through this issue.

Have a great day,

Rfoor1136
