Hello!

I wonder if IAS proxy scenario is possible while using 802.1X across 2 untrusted Server 2003 AD forests.

Let's imagine...a computer from Forest A is temporarily transported to Forest B. In Forest B we have IAS proxy forwarding Access-Request messages to Forest A. No user authentication is used.

My question is about the possibility to deploy such a scenario..if it is possible, then i am interested what is the attribute the IAS Proxy parses to make a correct forwarding (i know, the realm is used with a user-based authentication)

Hope for your help,

Aleks F.
