Which version of Entourage are you using? Do you know if the cert is actually correct and that you're contacting the server using the address that's in the cert?

I've successfully contacted our LDAP server over SSL using Entourage 2004, so MS's SSL code does seem to be doing the right sorts of checks using the right sorts of certificate databases on *my* Mac.

It might help if you can obtain your POP server's certificate and the certificate which signed it.

Cheers,

Chris
