Not with complex HTML, which is what I suspect you're referring to. Here's a workaround if you're interested:

Copy this script from a message from Allen Watson:

```
property browser : ""
```

```
if browser = "" then
```

```
    set browser to choose file of type "APPL" with prompt "Please select your default browser."
```

```
end if
```

```
tell application "Finder" to set defBrowserName to name of browser
```

```
tell application "Microsoft Entourage"
```

```
    set theMsg to item 1 of (get current messages)
```

```
    try
```

```
        if has html of theMsg is true then
```

```
            set pts to item 1 of (get parts of theMsg)
```

```
            set pts to parts of pts
```

```
            repeat with i from 1 to (count pts)
```

```
                set aPart to item i of pts
```

```
                set theType to type of aPart
```

```
                set theSubtype to subtype of aPart
```

```
                if theType is "text" and theSubtype is "html" then
```

```
                    set theHTML to content of aPart
```

```
                    exit repeat
```

```
                end if
```

```
            end repeat
```

```
            set tempfile to open for access "tempHTML2.html" with write
```

```
permission
```

```
                write theHTML to tempfile
```

```
                close access tempfile
```

```
                set theFile to "tempHTML2.html"
```

```
        else
```

```
            display dialog "Selected message seems to have no HTML to open."
```

```
        return
```

```
        end if
    on error theErr
        display dialog theErr
        return
    end try
end tell
set theDisk to path to startup disk as string
set theFile to theDisk & theFile
-- Give the file the creator type of the default browser
tell application "Finder"
    set f to alias theFile
    set ct to creator type of browser
    set ft to "TEXT"
    set creator type of f to ct
    set file type of f to ft
end tell
try
    set thePath to POSIX path of theFile
    set theDisk to text 1 thru -2 of theDisk -- remove delimiter
    set theURL to "file://" & theDisk & thePath
    tell application defBrowserName
        activate
        open location (theURL)
    end tell
on error theErr
    display dialog theErr
end try
delay 5
tell application "Finder" to delete theFile
tell application "Finder" to empty trash
```

Copy everything starting with "tell" and ending with "trash" and paste it into a blank script in Script Editor (/Applications/AppleScript/Script Editor/). Then, save it to the "Entourage Script Menu Items" folder in the Microsoft User Data folder. I called it "Open HTML in Browser". Then, when you're viewing a newsletter, click the Script menu (to the right of the Help menu), and select the "Open HTML in Browser" script. You'll be prompted to select a browser. Once you choose one, the newsletter will open in the browser, which will allow you to increase or decrease font size (process varies depending on browser; for Internet Explorer and Safari, the command is in the View menu, or on the toolbar if you've customized it).
