When I select the menu [Format | Column | Width...] the size is listed in inches instead of pixels/points, as it used to be.

I don't know how I switched this. How do I switch it back?

Column width has never been in pixels/points. In previous MacXL versions it was set in units which were equivalent to the width of the number characters for the default font (e.g., if the width was set to 10, then 10 number characters would fit in the cell).

MacXL04 changed this to inches/cm (depending on your preferences). You can still see the number of units if you click on the divider between columns in the column header.

To reliably set the column width in pixels or points requires using VBA.
