

Macro for table problems

Hi Everybody

I've created a table specifying all the properties in Word for Mac 2004.

Since I use the format for this particular table frequently, I've tried without success to create a macro for it.

I create a macro, insert Table (2 columns x 1 row), go to Table Properties, tick Preferred Width box and specify width, specify Indent from Left, go to Borders and Shading and specify No Borders, but then find that the Preferred Width and Indent measurements have disappeared. If I do it in reverse order, and then tab Row, I also lose the ticked Preferred Width measurements. If I go through and complete the other specs, and go back to Table, the macro doesn't produce the required table, but seems to insert some properties of its own, like width of column.

Since the original table appears in the document, I assume that its properties are valid.

I'll be indebted for advice.

Many thanks

John
