(Forgive me if this posts twice. I am not skilled at posting to a group.)

I have now done everything suggested. I disabled the duplicate fonts with the higher version number, and I also uninstalled and reinstalled my printer software, after hearing from HP that the software needed to be upgraded for the Intel Macs.

And still, the document created in Office X does not print correctly in Office 2004. The font and the margins are all wrong. This is a 417 p. document that represents 5 years of work. It needs to be presented properly. Thank heavens I did not trash Office X.

I am open to any other suggestions.

Thank you

Dr.G.

Please disregard this. Soon as it posted, I found the version number.

Will try your suggestion. Thanks.

d.

Thank you. Live and learn. There is indeed a dot next to the font I am using (Times New Roman.) And when I expand it, there is a dot next to Bold, Bold Italic, Italic and Regular. There are duplicates of each of these. I am not able, however to "hover over" each one to see the version number. Should I just disable the ones with the dot? How can I find the version number?

Thanks for your help

Dr.G.

Font Book is an Apple application which you should find in your user Applications folder. It comes with the system (OS X).

What do you mean, "Open the FontBook application?"

Beth Rosengard wrote:

It could be because Office 2004 uses some different (Unicode) fonts than Office X, even though the names are the same (like Times New Roman). If that's the case, you \*may\* be able to solve the problem by using FontBook to disable the Unicode version of the font. That would force Office 2004 to use the same version as Office X.

Open the FontBook application. On the left, select All Fonts and navigate to the font you've used in the document. If there's a dot to the right of the font name, then you have duplicate versions.

Click on the expand arrow to the left of the font name. Hover over each duplicate to see a balloon which will give you the font's version number. Disable the dupe with the highest version number by selecting it and clicking Disable.

Now try printing again and see if it makes a difference.

By the way, Unicode fonts

Re: Printing in Office 2004 vs. Office X

have many more characters  
available than  
non-Unicode fonts, so  
you'll probably want to  
re-enable the Unicode  
version  
of the font when you're done  
printing the doc.

Re: Printing in Office 2004 vs. Office X

looks as it should.  
None of the margins in the document have been changed. It just looks different printed in 2004.  
Fortunately, I can still open the document in Office X and print it out that way, but of course I would prefer not to have to do that. When I installed Office 2004, I did it by uninstalling the Test Drive program, and doing a standard (not custom) install.  
What do I need to do to ensure the document prints properly in 2004?  
Thank you
