I'm not sure what you mean by "memory, ram etc." as memory & RAM are the same thing. Also, "plenty" isn't a measurement system value I'm familiar with:) Less than 1 GB may hinder speed & more may be recommendable depending on the nature of your files & their content.

However, based on what you describe the first thought is to make sure Office is fully updated – current version is 11.3.4. Also, download & apply the OS X 10.4.9 COMBO updater from the Apple site (not the one Software Update delivers), then run Disk Utility – Repair Disk Permissions. See if performance improves.

I too have sluggish behavior in Word. I run Office for Mac 2004, 11.3 on a PowerPC G5, OSX, version 10.4.9. I have plenty of memory, ram etc. This appears to have started with either one of the system upgrades or Microsoft upgrades. It is very time consuming and does not seem to matter what else is running (even if Word is the only program running) or how soon after a re-start.
