Hi Tobias:

OK, so Open as "Text" and see if you can see what is wrong with the header:
change it, re-save it...

I have a horrible feeling you are running into a built-in limitation of
Word X --- Word X can't display most Unicode.

It would appear that the document might be coded for a double-byte character
set (e.g. a Japanese font). If so, those underscores show that it's
recognising the charset tag perfectly, but Word X can't display those
characters! Word 2004 "can".

I see in a second post you admitted the thing is in Japanese :-) Sorry:
You are going to struggle with that in Word X. Time to upgrade (wait for
2008 --- it will be further improved in its ability to do HTML-y and
Unicode-y things).

Cheers

Please reply in the group. Please do NOT email me unless I ask you to.

Re: Open html as source

Well, Word does not need to recognise the "Meta tag", it's the CharSet tag

I'm sure we both mean `<meta http-equiv="content-type" content="text/html; charset=utf-8">`

it needs to get hold of. It should recognise that OK, provided that the

It does when displaying rendered html. "View source" shows wide characters as two symbols, so I suppose it forgot that it's UTF8.
